

1. Lists

Mosaic recognises two list flavours at the block level. An unordered list is opened by a line starting with `-`; the marker renders as a `•` in the gutter to the left of the item's text, and the layout engine line-breaks long items while keeping every wrapped line flush with the first line's left edge:

- A short item.
- A long item authored as a single source line — the greedy line breaker wraps it onto a second visual line where the wrapped text hangs flush with the first line's left edge, never sliding back under the marker.
- *Italic*, **bold**, and `inline` code flow through unchanged inside an item.

Source-line continuation (a second `.mos` line that's *not* a fresh marker line) is out of scope in this slice. Such a line opens a new paragraph block at the page margin rather than continuing the current item. Author long items on a single source line and let the layout engine break them.

1.1. Nesting

A marker line indented deeper than its parent becomes a child of the most recent item at the outer indent — the parser compares relative indents, so any greater indentation works (two spaces is just the house convention). Indents nest arbitrarily deep, and marker kinds can change at deeper levels:

- Outer item one.
 - First nested child.
 - Second nested child, with *emphasis*.
- Outer item two.
 - Mixing marker kinds at a deeper level is fine:
 1. ordered grandchild,
 2. and another.
- Outer item three.

Marker kinds do **not** mix at the *same* indent — switching from `-` to `1.` (or vice versa) at one level closes the first list and opens a second adjacent one:

- unordered item, ends this list,
 1. ordered item, starts a new one.

1.2. Numbered lists renumber from 1

The digits typed in the source are ignored at render time — the layout engine numbers each item starting from 1, in source order:

1. first step,
2. second step,
3. and a long third step authored as a single source line that runs well past the right margin so the layout engine has to wrap it onto a second visual line at the same indent as the first — proving the hanging indent survives across wraps in numbered

lists too.

1.3. Right-aligned markers

Markers right-align against the inside edge of the gutter so the dots line up vertically across items of differing widths. Single-digit items sit further right than 10. or 12. , which is the standard typographic convention for numbered lists:

1. one,
2. two,
3. three,
4. four,
5. five,
6. six,
7. seven,
8. eight,
9. nine,
10. ten,
11. eleven,
12. twelve.

The gutter floor (`LIST_MARKER_GUTTER_PT`) accommodates up to two-digit markers at the default body size. Three-digit ordered lists trigger the adaptive gutter — the layout engine shapes every marker the list will emit and widens the gutter to fit the worst case — so a 200-item list still keeps its 200. clear of the indented text column.
